

Organic Chemistry Basics

SBI4U

MS. FRANKLIN

Carbon –Backbone of Biological Molecules

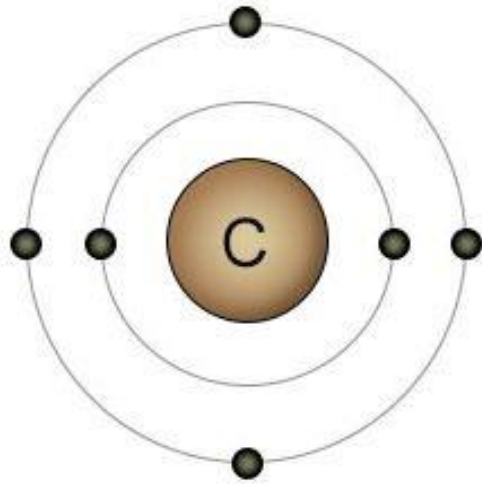

Organic Chemistry is the study of compounds that contain carbon-hydrogen bonds. Carbon is an important element that is present in all biological molecules, for example, macromolecules.

*All compounds that contain carbon are known to be '**organic compounds**'. Most of these organic molecules contain hydrogen atoms attached to the carbon element.*

Carbon –Backbone of Biological Molecules

Carbon has four valence electrons and is in turn able to form four covalent bonds '*tetravalence*'. This enables carbon to create complex molecules.

CH₄ (methane)

Due to its tetravalence, carbon usually forms a tetrahedron with angles of 109.5°.

C₂H₆ (ethane)

Carbon –Backbone of Biological Molecules

Carbon atoms always form four bonds, as shown below.

Carbon – Carbon Covalent Bonds

Due to its tetravalence, carbon atoms are able to join with one another and form single, double or triple bonds. Depending on the type of bond formed, the shape of the molecule will change.

Single bond

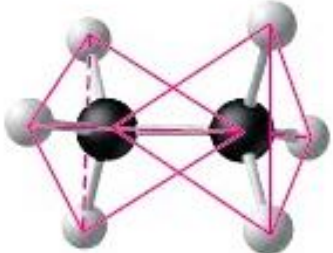

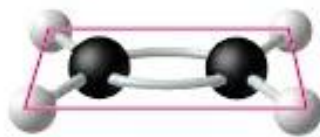

Double bond

Triple bond

Shapes of Simple Organic Molecules

Name and Comment	Molecular Formula	Structural Formula	Ball-and-Stick Model (molecular shape in pink)
(a) Methane. When a carbon atom has four single bonds to other atoms, the molecule is tetrahedral.	CH ₄	$\begin{array}{c} \text{H} \\ \\ \text{H}-\text{C}-\text{H} \\ \\ \text{H} \end{array}$	
(b) Ethane. A molecule may have more than one tetrahedral group of single-bonded atoms. (Ethane consists of two such groups.)	C ₂ H ₆	$\begin{array}{c} \text{H} \quad \text{H} \\ \quad \\ \text{H}-\text{C}-\text{C}-\text{H} \\ \quad \\ \text{H} \quad \text{H} \end{array}$	
(c) Ethene (ethylene). When two carbon atoms are joined by a double bond, all atoms attached to those carbons are in the same plane; the molecule is flat.	C ₂ H ₄	$\begin{array}{c} \text{H} \quad \quad \text{H} \\ \diagdown \quad / \\ \text{C} = \text{C} \\ / \quad \quad \diagdown \\ \text{H} \quad \quad \text{H} \end{array}$	

The 3D shape of an organic molecule will change depending on the carbon-carbon bonds.

Major Elements in Organic Molecules

Due to its tetravalence, carbon atoms tend to bind to one another or to three other common elements; *hydrogen, oxygen and nitrogen*.

Hydrocarbons: organic molecules consisting only of carbon and hydrogen.

Carbon Skeleton Variation

Carbon chains can vary in terms of their length, bonds, branching and ring structures. The differences enable each of the molecules to play a different role in a biological system.

(a) Length

Ethane

Propane

(c) Double bond position

1-Butene

2-Butene

(b) Branching

Butane

2-Methylpropane
(isobutane)

(d) Presence of rings

Cyclohexane

Benzene

Unsaturated carbon chains may contain double or triple bonds between the carbon atoms.

Saturated vs. Unsaturated Carbon Chains

Saturated

alkane

Unsaturated

alkene

Polyunsaturated

alkyne

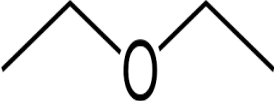

Checking for Understanding

Which of the following hydrocarbons has a double bond in its carbon skeleton?

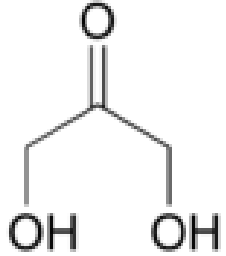

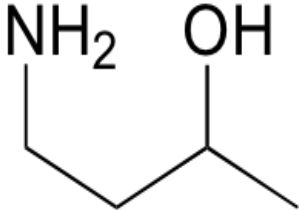

Representing Organic Molecules

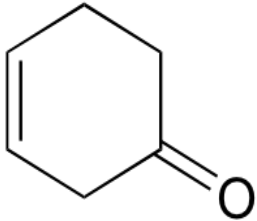

Considering that C and H atoms are the basis of every organic molecule, it is not necessary to draw them out every single time. There are other simplified methods that can be used to represent organic molecules.

Molecular Formula	Structural Formula	Modified Structural Formula	Line Diagram (skeletal Formula)
$C_4H_{10}O$	$\begin{array}{ccccccc} & H & H & & H & H & \\ & & & & & & \\ H & -C & -C & -O & -C & -C & -H \\ & & & & & & \\ & H & H & & H & H & \end{array}$	$\begin{array}{ccccccc} & & & & & & \\ -C & -C & -O & -C & -C & - & \\ & & & & & & \end{array}$	

Let's Practice

Line Diagram	Structural Formula	Molecular Formula
 <p>A line diagram of tartaric acid (2,3-dihydroxybutanedioic acid). It shows a four-carbon chain. The first carbon is part of a carboxyl group with a double bond to an oxygen atom above it. The second and third carbons each have a hydroxyl group (-OH) attached. The fourth carbon is also part of a carboxyl group, with a double bond to an oxygen atom above it.</p>		
 <p>A line diagram of 2-amino-3-methylbutan-1-ol. It shows a four-carbon chain. The first carbon has an amino group (-NH₂) attached. The second carbon has a hydroxyl group (-OH) attached. The third carbon has a methyl group (-CH₃) attached. The fourth carbon is a terminal methyl group.</p>		

Let's Practice

Line Diagram	Structural Formula	Molecular Formula
 <p>The line diagram shows a six-membered ring with a double bond on the left side and a carbonyl group (=O) on the right side.</p>		

Isomers

Isomers are compounds that share the same molecular formula. Thus, the molecules will have the same types and number of elements, but the manner in which they are arranged will differ.

Three Types of Isomers:

1. Structural Isomer:
2. Geometric Isomer:
3. Enantiomers:

1. Structural Isomers

Butane

Isobutane

Butane and isobutane are two compounds that have the exact same molecular formula.

What is the molecular formula?

1. Structural Isomers - Practice

Circle the molecules that are isomers. (Hint: Determine the molecular formula)

1. Structural Isomers – Practice

There are five isomers of hexane (C₆H₁₄)... **How many can you draw?**

Additional details: there are only single bonds, and there are no ring structures.

2. Geometric Isomers

Geometric isomers are also known as '*cis-trans isomers*'. The double or triple bond can change the orientation of substituent groups.

cis = Groups are on same side

cis-2-butene

trans = Groups are on different sides

trans-2-butene

Ex. 2

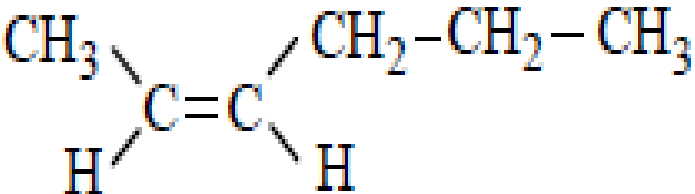

cis-1,2-dichlorocyclohexane

trans-1,2-dichlorocyclohexane

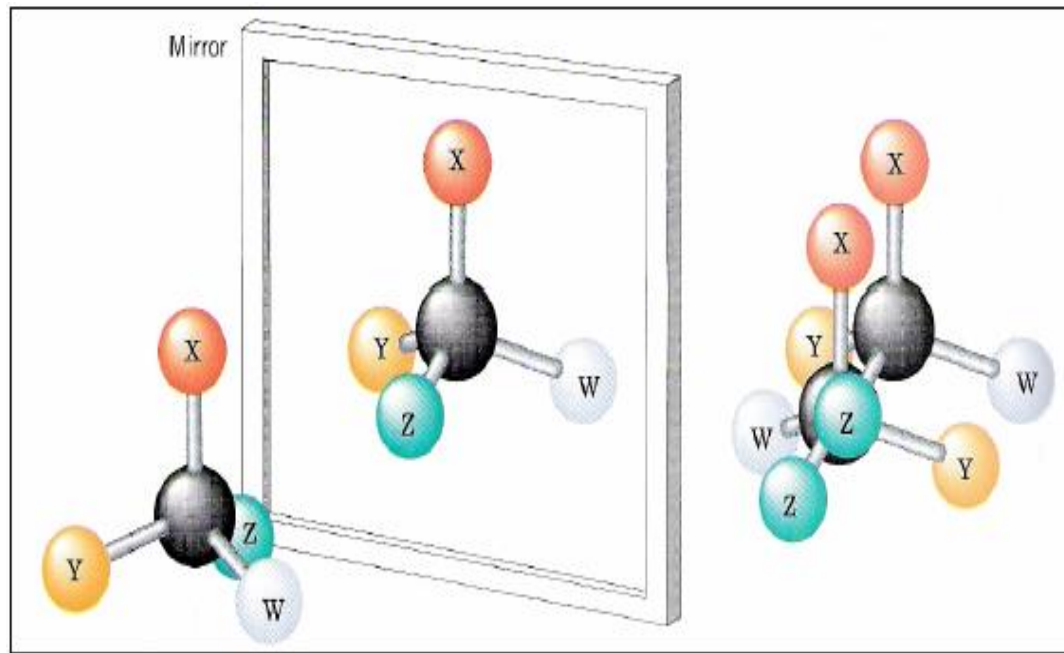

2. Geometric Isomers – Practice

1. Complete the name of this cis/trans isomer.
2. Draw and name the other geometric isomer of this molecule.

	
_____ - 2- hexene	_____ - 2- hexene

3. Enantiomers

Enantiomers differ in their arrangement of atoms around the chiral carbon. A **chiral carbon** is bonded to four different atoms.

Because they are mirror images of one another, they cannot be superimposed.

3. Enantiomers – Practice

Circle the molecules that can have enantiomers.

Homework

- Complete the worksheets given in class
